According to our (Global Info Research) latest study, the global Scanning Electron Microscope (SEM) market size was valued at US\$ 3982 million in 2025 and is forecast to a readjusted size of US\$ 5373 million by 2032 with a CAGR of 4.4% during review period.

A scanning electron microscope (SEM) is a type of electron microscope that produces images of a sample by scanning the surface with a focused beam of electrons. The electrons interact with atoms in the sample, producing various signals that contain information about the surface topography and composition of the sample. The electron beam is scanned in a raster scan pattern, and the position of the beam is combined with the intensity of the detected signal to produce an image. In the most common SEM mode, secondary electrons emitted by atoms excited by the electron beam are detected using a secondary electron detector (Everhart-Thornley detector). The number of secondary electrons that can be detected, and thus the signal intensity, depends, among other things, on specimen topography. SEM can achieve resolution better than 1 nanometer.

Global main manufacturers of scanning electron microscope (SEM) include Thermo Fisher Scientific, Hitachi High-Technologies Corporation and Jeol Ltd., etc. The top three players hold a share around 64%. The global scanning electron microscopes (SEM) are mainly produced in United States and Japan, they occupied for a share over 70%. Asia-Pacific is the largest market, has a share about 41%, followed by North America and Europe, with share 27% and 25%, separately.
