The scanning contact probe is an instrument for surface topography measurement and microscopic observation. It is based on contact force and scanning technology, through the physical contact of the probe with the sample surface to obtain the surface topography and characteristics of the sample. Scanning contact probes are widely used in materials science, nanotechnology, surface topography research, biomedicine and other fields. It can measure the surface topography of various materials including metals, ceramics, polymers and more. Scanning contact probes have high resolution, accuracy and flexibility, and can provide surface topography information at the microscopic scale, which plays an important role in material analysis, characterization and research.
