## Abstracts

According to our (Global Info Research) latest study, the global Scanning Electron Microscope Imaging Lens market size was valued at US\$ 649 million in 2025 and is forecast to a readjusted size of US\$ 1156 million by 2032 with a CAGR of 8.7% during review period.

Scanning electron microscope imaging lens, as one of the core components of scanning electron microscope (SEM), plays a vital role. The scanning electron microscope imaging lens is a key part of the scanning electron microscope for receiving and forming the surface image of the inspected object. It receives the signal (such as secondary electrons, backscattered electrons, etc.) generated by the electron beam scanning the surface of the sample and converts it into a visual image for researchers to observe and analyze.

The scanning electron microscope imaging lens is usually composed of multiple complex lenses and detectors, which work together to complete the signal reception, conversion and imaging process. Among them, the electron gun is used to generate a high-energy electron beam, and the electromagnetic lens is used to focus the electron beam and control its scanning path. The detector is responsible for receiving the signal generated by the interaction between the electron beam and the sample and converting it into an electrical signal.
