## Abstracts

The global Screen Printing Mesh for MLCC market size is expected to reach \$ 251 million by 2032, rising at a market growth of 5.6% CAGR during the forecast period (2026-2032).

In 2025, global Screen Printing Mesh for MLCC production reached approximately 5,500 k sqm with an average global market price of around US\$ 26 per sqm, and a gross profit margin of approximately 10%-30%. Screen Printing Mesh for MLCC refers to ultra-precision screen fabrics used to print electrode and dielectric layers during multilayer ceramic capacitor manufacturing. The mesh must deliver stable aperture geometry and high tension retention to control paste deposition thickness, line definition, and registration over long production runs. Materials are typically high-modulus polyester monofilament, stainless steel, or hybrid meshes selected for low elongation, solvent resistance, and cleanliness. Key requirements include uniform weave, controlled open area, minimal contamination, consistent heat-setting, and compatibility with photoemulsions and cleaning chemicals. Performance directly affects layer uniformity, defect rate, and yield in high-volume ceramic printing environments. The industrial chain of Screen Printing Mesh for MLCC includes upstream inputs such as polymer chips or stainless wire, weaving auxiliaries, and surface treatment chemicals. Midstream processes cover filament drawing and heat-setting, precision weaving, scouring and surface treatment, inspection and grading, and roll cutting/packaging. Downstream applications focus on ceramic electronics thick-film printing steps, including electrode paste printing and related functional layer deposition. Supporting services include mesh pretensioning, screen stretching, tension verification, and process guidance to maintain stable registration and repeatable paste transfer during continuous production.
