According to our (Global Info Research) latest study, the global Screw Driven Actuators market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Screw-driven actuators are mechanical devices used to convert rotational motion into linear motion or vice versa. They consist of a threaded screw shaft and a nut that moves along the length of the screw. When the screw is rotated, the nut moves linearly along the screw's axis, resulting in either an extension or a retraction of the actuator's length.

Screw-driven actuators are widely used in various industries for linear positioning tasks, lifting heavy loads, precise movement control, and many other applications where linear motion is required. Their simplicity, reliability, and ease of integration make them a popular choice in engineering and automation systems.
