Abstracts

The global Screw Turbine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Screw turbine, also known as an Archimedes' screw turbine, is a type of hydro turbine used for generating renewable energy from flowing water. It operates based on the principle of the Archimedes' screw, a device historically used for lifting water.

Screw turbine consists of a helical screw-shaped rotor mounted on a shaft within a cylindrical casing. As water flows through the turbine, the rotating screw captures the kinetic energy of the water and converts it into mechanical energy. The mechanical energy is then used to drive a generator for the production of electricity.

Screw turbines are especially suitable for low-head and low-flow hydropower applications, such as small rivers, irrigation canals, and wastewater treatment plants. They are known for their simplicity, reliability, and suitability for handling solid-laden water. Additionally, screw turbines can operate in both directions, allowing them to function efficiently regardless of the water flow direction.

This report studies the global Screw Turbine production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Screw Turbine, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
