Abstracts

The global Sealing Glass market size is expected to reach \$ 516 million by 2032, rising at a market growth of 4.3% CAGR during the forecast period (2026-2032).

To manufacture hermetic and highly insulating electrical seals between different materials such as metal or ceramics, the use of sealing glasses is wide spread in the electronics industry. Sealing glasses typically have a processing temperature of 800–1000°C. Sealing glasses mostly belong to the borosilicate and aluminosilicate glass families. To manufacture reliable hermetic seals, the correct choice of coefficient of thermal expansion (CTE) is a key factor. The applied glass composition depends on the materials which should be joined, the required temperature profile as well as their CTE. For matched seals, the CTE of the glass is matched as closely as possible to those of the sealing partners. In case of compression seals, a well-defined mismatch of the CTE is used intentionally to compress the sealing materials onto each other. Solder glasses, also referred to as frit glasses, are special glasses with a particularly low softening point (below 550°C). They are used to join glass to other glasses, ceramics, or metals without thermally damaging the materials to be joined. To ensure stress-free sealing, the coefficient of thermal expansion (CTE) needs to be closely matched to the sealing partners.

Global Sealing Glass key players include Schott AG, Elan Technology, AGC, Nippon Electric Glass, Johnson Matthey, etc. Global top five manufacturers hold a share about 80%. Asia-Pacific is the largest market, with a share about 45%, followed by Europe and North America, both with a share about 25 percent. In terms of product, Low Temperature Type is the largest segment, with a share about 60%. And in terms of application, the largest application is Electronics and Semiconductors, followed by Battery, Home Appliances, etc.
