Seamless Rolled Ring Forgings are circular metal components fabricated through a specialized forging process that begins with a solid cylindrical billet of metal. The billet is heated and then subjected to a sequence of operations like upsetting, piercing, and rolling, which transform it into a seamless ring shape. This process enables precise control over the ring's dimensions, internal and external geometries, and grain structure, resulting in a final product with high strength, excellent mechanical properties, and no weld seams, making them highly suitable for various applications in industries such as aerospace, automotive, power generation, and heavy machinery.
