Abstracts

According to our (Global Info Research) latest study, the global Seasonal Vaccines market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The driving factors for seasonal vaccines mainly include the following aspects:

Seasonal epidemic outbreaks: Seasonal vaccines target diseases that occur during specific seasons or at the peak of an epidemic. For example, the epidemic of viral or bacterial diseases such as influenza and pneumonia has obvious seasonality, so the relevant vaccines are also seasonal. The outbreak cycles and epidemic trends of these diseases are important factors in promoting vaccine development and production.

Advances in vaccine technology: As vaccine technology continues to advance, more vaccines against specific pathogens are being developed. These new vaccines can better prevent diseases, improve immunity and reduce side effects. For example, the research and development technology for influenza vaccines has been continuously updated, from whole-virus inactivated vaccines to split vaccines, and now to genetically recombinant vaccines. These technological advances have provided impetus for the development of seasonal vaccines.

Promotion of public health policies: Governments and public health agencies play an important role in the promotion and vaccination of seasonal vaccines. They promote the development, production and vaccination of seasonal vaccines by formulating relevant policies and regulations. For example, the government may provide financial support for seasonal vaccines or encourage people to take seasonal vaccines through vaccination

programs.

Globalization and the rise of tourism: With globalization and the rise of tourism, people have increased mobility between different regions, which allows diseases to spread more quickly and widely. This increases demand for seasonal vaccines, as people need to be vaccinated before traveling or during specific seasons to prevent illness.

Increased public health awareness: As public health awareness increases, more and more people are aware of the importance of vaccination. They are more concerned about the safety and effectiveness of vaccines and are willing to take the initiative to take seasonal vaccines to prevent diseases.
