A seawater cooling system is an alternative cooling technology that utilizes cold seawater as a natural coolant. Here's a breakdown of its function:

**Heat Exchanger:** Seawater is pumped through a heat exchanger, where it absorbs heat from a closed-loop freshwater system. This freshwater loop circulates through the equipment or building requiring cooling.

**Temperature Regulation:** The cool seawater lowers the temperature of the freshwater in the closed loop.

**Chilled Water Distribution:** The chilled freshwater is then distributed to the target area for air conditioning or industrial process cooling.

**Seawater Discharge:** After absorbing heat, the warmed seawater is discharged back into the ocean.
