According to our (Global Info Research) latest study, the global Seawater Radiation Detection Equipment market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Seawater radiation detection equipment is a common detection equipment that measures the radiation released by a sample to determine the concentration of radioactive materials in it. Portable radiometers are suitable for on-site sampling and monitoring, while larger laboratory equipment can provide higher accuracy and resolution.

Japan started discharging nuclear wastewater into the sea on August 24, and it is expected to last 30 years. Nuclear wastewater treated by ALPS has removed most radionuclides (except tritium). Radioactive isotopes such as tritium and carbon-14 are still present in the nuclear wastewater discharged into the sea, which may pose risks to human health through the marine food chain. Concerns about nuclear radiation have increased the demand for nuclear pollution treatment & radioactive element monitoring, and are expected to drive the development of the seawater radiation detection equipment market in the long term.
