Abstracts

The global Seawater Radiation Detection Equipment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Japan started discharging nuclear wastewater into the sea on August 24, and it is expected to last 30 years. Nuclear wastewater treated by ALPS has removed most radionuclides (except tritium). Radioactive isotopes such as tritium and carbon-14 are still present in the nuclear wastewater discharged into the sea, which may pose risks to human health through the marine food chain. Concerns about nuclear radiation have increased the demand for nuclear pollution treatment & radioactive element monitoring, and are expected to drive the development of the seawater radiation detection equipment market in the long term.

Seawater radiation detection equipment is a common detection equipment that measures the radiation released by a sample to determine the concentration of radioactive materials in it. Portable radiometers are suitable for on-site sampling and monitoring, while larger laboratory equipment can provide higher accuracy and resolution.

This report studies the global Seawater Radiation Detection Equipment production, demand, key manufacturers, and key regions.
