According to our (Global Info Research) latest study, the global Seawater Reverse Osmosis RO Membrane market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Seawater reverse osmosis (RO) membrane is a reverse osmosis membrane used for seawater desalination. Desalination is the process of converting salty seawater into fresh water that can be used for drinking, agricultural irrigation, and industrial purposes. In seawater desalination, reverse osmosis technology is a common method in which seawater is forced through a reverse osmosis membrane through pressure, thereby isolating salt and other impurities to obtain fresh water. Seawater RO membrane is a reverse osmosis membrane specially designed to handle high-salinity seawater. Compared with traditional freshwater RO membranes, seawater RO membranes need to have higher salt barrier properties in order to effectively remove salt, microorganisms and other pollutants in seawater while maintaining high water flux.
