Abstracts

The global Second Generation Superconducting Tape market size is expected to reach \$ 10430 million by 2029, rising at a market growth of 5.7% CAGR during the forecast period (2023-2029).

From the perspective of high-temperature superconducting applications, due to its technological advancement and irreplaceability in specific fields, the future prospects are quite broad. Although domestic superconducting material preparation and superconducting application companies are currently in a continuous loss situation, various superconducting companies still maintain continuous investment in superconducting research and development technology. With the development of large-scale commercial applications in downstream fields such as controllable nuclear fusion and high-temperature superconducting induction heating equipment, and showing accelerated release, the high-temperature superconducting industry is ushering in large-scale commercialization. The market scale of global high-temperature superconductors is expected to continue to expand as the application scenarios continue to expand, and there is a market space of tens of billions, which is the key driving force for the continuous growth of the global superconducting materials market.

High-temperature superconducting materials are superconducting materials with a high critical transition temperature (T_c) that can work at the temperature of liquid nitrogen. Because it is mainly an oxide material, it is also called a high-temperature oxide superconducting material.
