Abstracts

The global Secondary Liquid Injection Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The secondary liquid injection machine in the lithium-ion battery industry is a device used in the production of lithium-ion batteries, mainly used for secondary liquid injection operations on batteries. In the production process of lithium-ion batteries, the contact between the positive and negative electrode plates of the battery and the electrolyte is very important, and the secondary liquid injection machine is used to ensure good contact between the positive and negative electrode plates of the battery and the electrolyte. The working principle of the secondary liquid injection machine is to accurately inject the electrolyte into the battery through the liquid injection system, ensuring sufficient contact between the positive and negative electrode plates inside the battery and the electrolyte. This can improve the performance and cycle life of the battery, reduce the internal resistance of the battery, and improve the energy conversion efficiency of the battery. Secondary liquid injection machines usually have precise liquid injection control systems that can adjust the liquid injection volume according to production needs and battery specifications. At the same time, the secondary liquid injection machine also has efficient liquid injection speed and stable liquid injection quality, which can achieve efficient and stable production processes. In summary, the secondary liquid injection machine in the lithium-ion battery industry is a device used in battery production, mainly to ensure good contact between the positive and negative electrode plates of the battery and the electrolyte, improve the performance and cycle life of the battery.
