Abstracts

The global Security Patrol Humanoid Robot market size is expected to reach \$ 2042 million by 2032, rising at a market growth of 38.1% CAGR during the forecast period (2026-2032).

A security patrol humanoid robot is an autonomous mobile machine equipped with multimodal environmental sensing and human-like upper-body morphology, designed to traverse structured outdoor and indoor perimeters while detecting intrusion, leakage, fire, or equipment anomaly in real time. Its design rationale is to replace static fixed cameras and wheeled inspection carts in scenarios where the patrol path includes stairs, narrow doorways, or equipment panels that require manual opening or button pressing for inspection, thereby extending coverage to spaces inaccessible to conventional automated patrols. The core advantage lies in its ability to integrate visual, thermal, and acoustic anomaly detection into a single moving platform that can physically interact with its environment, such as swinging open a door or flipping a panel latch, without requiring structural modifications to the facility. This configuration enables the robot to deliver continuous, on-site verification rather than mere video relay, converting it from a passive surveillance tool into an active inspection agent that can confirm the state of doors, valves, and indicators at the point of interest. In 2025, global Security Patrol Humanoid Robot Application production reached approximately 2423 units with an average global market price of around k US\$85 per unit.

The humanoid robot for security patrol and inspection industry is evolving from custom designs for specific scenarios toward standardized product repeat purchases. The core value of this product category lies in its mandatory capabilities of autonomous navigation, obstacle avoidance, and environmental anomaly perception. Its cost focus is concentrated on LiDAR fusion positioning modules and visual recognition algorithms for

low-light environments, rather than the bipedal balance and fine manipulation emphasized by traditional humanoid robots. Hikvision and Dahua Technology disclosed in official news that their security robots, featuring a wheeled chassis combined with a humanoid upper body, have been deployed for routine nighttime patrols in multiple domestic chemical parks and substations. This indicates that enterprise revenue is shifting from single-unit equipment sales to an annual service fee model that includes algorithm updates and maintenance support.

In relevant guiding opinions jointly issued by the Ministry of Public Security and the Ministry of Emergency Management, the promotion of unmanned security patrol and protection in key facilities is explicitly encouraged. This prompts companies to shift their profit focus toward the development of digital twin-based autonomous patrol path planning platforms and multi-robot cluster scheduling systems. From the customer willingness-to-pay perspective, the annual reports of State Grid and China National Petroleum Corporation show that they have included security patrol robots in their annual maintenance procurement catalogs. However, they prefer a payment method based on mileage fees plus a minimum guarantee fee for abnormal event response, attempting to control the impact of initial hardware expenditure on profits. Meanwhile, Ubtech and iFLYTEK have entered the field by retrofitting existing wheeled chassis with dual-arm manipulation modules, valuing the service premium brought by additional actions such as door opening and button pressing in security scenarios. Overall, profits in the humanoid robot for security patrol and inspection industry are shifting from equipment manufacturing toward algorithm subscription and data feedback analysis. Companies that first establish large-scale operational maintenance databases will gain the initiative in profit sharing.
