Abstracts

The global Seismic Dampers in Buildings market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Seismic Dampers are used in damping the oscillations of a building during an earthquake. There are many types of dampers for buildings, and damping through friction tends to be one of the most efficient methods of dissipating seismic energy. The friction damper operates by dissipating kinetic energy through friction. The Dampers allow the building to move elastically and dissipate the energy of the earthquake. This, in turn, produces substantial savings as structural elements can be optimized for cost savings.

This report studies the global Seismic Dampers in Buildings production, demand, key manufacturers, and key regions.
