According to our (Global Info Research) latest study, the global Seismic Elastomeric Face Seal System market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Seismic elastomeric face seal system is a type of sealing arrangement used in construction or infrastructure projects to accommodate movement or vibration induced by seismic activities. It typically consists of elastomeric materials, such as rubber or synthetic compounds, strategically placed between two structural elements to provide flexibility and absorb seismic forces. This system helps reduce the transmission of vibrations and minimizes the potential for damage or failure in structures during earthquakes or other seismic events. The elastomeric face seal acts as a buffer, allowing controlled movement and absorbing energy to protect the integrity of the structure.
