Seismic Isolation Rubber Bearing Elastomeric Damper Unit is a structural isolation component used to reduce earthquake forces transmitted from foundations to buildings, bridges and infrastructure. It combines rubber layers, steel plates and damping materials to provide horizontal flexibility, vertical load capacity and energy dissipation. The product is used in hospitals, schools, public buildings, bridges, rail structures, data centers and critical facilities in seismic regions. The market includes rubber bearings and elastomeric damping units, but excludes steel-only bearings, ordinary bridge pads and full structural engineering services.

The industry chain includes natural rubber, synthetic rubber, steel plates, bonding agents, damping additives, molds, vulcanization equipment and testing instruments. Midstream production includes rubber compounding, steel plate treatment, layering,

vulcanization, bonding, machining, load testing, shear testing and durability inspection. Downstream demand comes from building construction, bridge engineering, rail transit, public infrastructure, earthquake retrofitting and critical facility protection. Growth is driven by seismic safety codes, urban renewal, infrastructure investment and demand for resilient buildings.
