According to our (Global Info Research) latest study, the global Seismic Reduction and Isolation System for Buildings market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

An earthquake is a natural disaster that produces massive ground shaking that can cause the collapse, damage, or instability of buildings and equipment. Seismic Reduction and Isolation System for Buildings are designed to reduce the impact of earthquake-induced vibrations on buildings and equipment by using a variety of techniques and devices to secure or restrain buildings and equipment in their place. These systems typically include components such as isolators, dampers, and support systems. The design and installation of Seismic Restraint Systems needs to be based on the seismic activity level of the seismic area, the characteristics of the building and equipment, and the corresponding design guidelines and standards. Its purpose is to protect personnel's lives, reduce property losses, and ensure that buildings and equipment have sufficient seismic resistance in earthquakes.
