According to our (Global Info Research) latest study, the global Seismic Spring Isolators market size was valued at US\$ 688 million in 2024 and is forecast to a readjusted size of USD 865 million by 2031 with a CAGR of 3.4% during review period.

Seismic spring isolators are devices that use the principle of spring elasticity to reduce the impact of earthquakes on equipment. By setting a spring isolation layer between the equipment and the ground, the equipment can move relatively under the elastic action of the spring when an earthquake occurs, thereby avoiding or reducing the direct impact of seismic waves on the equipment. Seismic spring isolators have the advantages of simple structure, easy installation, and low cost, and can provide good seismic isolation effects. In areas prone to earthquakes, seismic spring isolators have been widely used in seismic isolation protection of various types of equipment.
