Abstracts

According to our (Global Info Research) latest study, the global Selective Plane Illumination Microscope (SPIM) market size was valued at USD 130.7 million in 2022 and is forecast to a readjusted size of USD 211 million by 2029 with a CAGR of 7.1% during review period.

Reduced Phototoxicity and Photobleaching: SPIM uses a thin sheet of laser light to illuminate the sample only in the imaging plane, minimizing exposure to light and reducing phototoxicity and photobleaching. This is particularly important for live cell imaging, as it allows longer observation periods without damaging the sample.

High-Speed Imaging: SPIM enables high-speed imaging of biological processes due to its ability to quickly capture 3D images of large samples. This makes it suitable for studying dynamic cellular events and fast biological processes.

Multiview Imaging: SPIM typically allows for the acquisition of multiple views or angles of the same sample. These views can be computationally fused to create a 3D reconstruction with improved image quality and reduced artifacts.
