Abstracts

According to our (Global Info Research) latest study, the global Self-amplifying RNA (saRNA) Drugs market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

saRNA is an RNA that shares many structural similarities with mRNA: it is a linear, single-stranded RNA molecule synthesized from a 5' cap, a 3' poly(A) tail, and 5' and 3' UTRs. The main difference is that saRNA is a larger molecule because it encodes four additional proteins in addition to the vaccine antigen or gene of interest. These four additional proteins are nonstructural proteins, usually derived from alphaviruses, encoding replicase enzymes. This replicase is able to amplify the original RNA strand upon delivery to cells, resulting in higher amounts of protein expression with minimal RNA dosage required.
