According to our (Global Info Research) latest study, the global Self-etch Bonding Agent market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A self-etch bonding agent is a dental adhesive system used in restorative dentistry to bond composite materials to tooth structures (enamel and dentin) without the need for a separate etching step. In contrast to the total-etch system, which requires an etching phase with phosphoric acid, self-etch adhesives incorporate an etching component within the bonding agent itself, eliminating the need to apply, rinse, and dry a separate acid etchant.
