## Abstracts

The global Self-etching Adhesive market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Self-etching adhesive is a material used in the field of dentistry, commonly used in tooth restoration and tooth bonding procedures. It is an acidic adhesive used to improve the bond between tooth tissue and restorative materials.

The main function of self-etching adhesives is to form a microscopic acidic rough layer on the tooth surface, which can form a good bond with restorative materials (such as composite resin). This rough layer increases the surface contact area between the adhesive and the restorative material, increasing the strength and durability of the bond between them.

This report studies the global Self-etching Adhesive production, demand, key manufacturers, and key regions.
