## Abstracts

According to our (Global Info Research) latest study, the global Self-learning Chip market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Self-learning Chip refers to learning like the human brain. This means it is designed to learn from its environment. The chip can be used in a range of AI-intensive applications, but the company says it will be particularly influential in industrial automation and personal robotics.

Many companies and research institutes work on developing chips specifically designed to accelerate machine learning tasks to improve efficiency and performance. Chips for neural network applications are also evolving. The design of these chips is inspired by the neuronal networks of the human brain and aims to enable more efficient neural network computation. With the growth of the Internet of Things (IoT), there is an increased demand for chips that can perform intelligent processing on edge devices. These chips are capable of performing a number of intelligent tasks locally on the device, reducing the dependence on cloud services. Some chip designs are geared towards enabling adaptive learning that can automatically adjust and optimize to changes in the environment and tasks. This is different from traditional fixed-function chips, which are more adaptive to dynamic environments. Quantum computing is a cutting-edge technology in computing, and although it is still in the research phase, its development has received widespread attention.
