Self-regulating electric heat cable has a special conductive core between the two bus wires. This core becomes more conductive during cold ambient conditions; therefore the heating cable will increase its wattage per linear foot in response to the cold. This feature makes it ideal for the freeze protection of pipes in the winter or for keeping gutters clear of ice formations. This type of cable will also decrease its power output (watts per linear ft.), in warmer conditions, when the higher temperature will make the special core less conductive.
