Abstracts

The global Self-sealing Globe Valve market size is expected to reach $ 329 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

In 2025, global production of Self-sealing Globe Valves, more commonly referred to in the industry as Pressure Seal Globe Valves, was approximately 185,000 units, with an average price of around USD 1,180 per unit. A Self-sealing Globe Valve is an industrial globe valve primarily designed for high-temperature and high-pressure service. Its key feature is a pressure-seal bonnet that utilizes internal process pressure to force the sealing ring against the bonnet and body, generally increasing sealing effectiveness as system pressure rises. Typical products consist of a valve body, pressure-seal bonnet, stem, disc, seat, pressure-seal ring, packing, and handwheel or actuator. Common materials include WCB, WC6, WC9, F11, F22, F91, stainless steel, and specialty alloys. Mainstream products are concentrated in ASME Class 600–2500 and higher pressure ratings and may use T-pattern, Y-pattern, or angle-pattern flow configurations. Major applications include thermal and nuclear power generation, boiler feedwater, main steam systems, refining, petrochemicals, high-pressure steam, and other high-temperature and high-pressure industrial processes.

The global Self-sealing Globe Valve market is experiencing steady growth, driven primarily by high-parameter power plants, refinery and petrochemical facilities, high-pressure steam systems, and replacement of installed high-pressure valves. Compared with conventional bolted-bonnet designs, pressure-seal construction is particularly suitable for high-pressure environments, resulting in strong demand for Class 900, 1500, 2500, and similar high-pressure products. As industrial facilities move toward higher operating temperatures and pressures, demand is increasing for Cr-Mo alloy steels, high-temperature materials such as F91, CoCr hard-faced seating surfaces, low-

emission packing, and improved thermal-cycle durability. Future products will continue to develop toward higher pressure ratings, lower fugitive emissions, greater erosion resistance, and increased use of electric and pneumatic actuation. Nuclear power, high-efficiency thermal power, refinery modernization, and high-temperature and high-pressure process facilities will remain important application areas.
