Abstracts

The global Selinexor Tablets market size is expected to reach \$ 364 million by 2032, rising at a market growth of 11.0% CAGR during the forecast period (2026-2032).

Selinexor Tablets are an oral selective inhibitor of nuclear export. By selectively inhibiting the nuclear export protein XPO1, they promote the accumulation of tumor suppressor proteins in the cell nucleus and restore their tumor-suppressive functions, thereby inducing apoptosis of tumor cells. As the world's first approved XPO1 inhibitor, this drug is mainly indicated for the treatment of hematologic malignancies such as relapsed or refractory multiple myeloma and diffuse large B-cell lymphoma, providing a new targeted therapeutic option for advanced patients who have failed multiple lines of therapy. In 2025, global Selinexor Tablets production reached approximately 35,000 bottles.

As the world's first orally administered selective XPO1 inhibitor approved globally, selinexor occupies an important and differentiated market position in the field of relapsed and refractory hematologic malignancies by virtue of its unique mechanism of action. Its core market value lies in providing a breakthrough therapeutic option for advanced patients who have failed multiple lines of treatment and developed resistance to conventional regimens, effectively addressing the unmet clinical needs. Worldwide, the drug has achieved broad market access and continuously improves its accessibility and market penetration through ongoing expansion of indications, advancement of combination therapies, and inclusion in the medical insurance systems of multiple countries. The current market landscape is characterized by dominance of the originator product and regional exclusive licensing and distribution, while facing challenges including generic competition, research and development competition from drugs targeting the same target, and promotion difficulties caused by safety management. In

the long run, its market potential highly depends on the successful expansion of indications into the field of solid tumors, optimization of administration regimens, and deepening of the global commercialization network. The drug is in a critical growth stage transitioning from a niche orphan drug to a broad-spectrum targeted therapy, with both opportunities and challenges coexisting.
