## Abstracts

The global SEM Repair Service market size is expected to reach \$ 463 million by 2032, rising at a market growth of 3.0% CAGR during the forecast period (2026-2032).

SEM maintenance service refers to the professional maintenance service of SEM brand servo motors, servo drives and other equipment. These equipment are widely used in industrial automation, robot control, CNC machine tools and other fields, so their maintenance service is also particularly important. The core objective is to ensure stable equipment operation, improve imaging quality and measurement accuracy through professional technical means, and meet the needs of scientific research, industrial testing, and other scenarios for microstructure analysis. Services require the integration of knowledge from multiple disciplines such as electro-optics, vacuum technology, and data processing to ensure the reliability and durability of equipment at nanometer-level resolution. The industry gross profit margin is approximately 30-50%.

Market drivers mainly include the following:

Policy support and localization process: National policies promoting the localization of high-end instruments accelerate the demand for domestic repair services. For example, the '02 Special Project' supports the R&D of key components, and local tax incentives encourage local companies to establish repair centers, forming a virtuous cycle of 'policy guidance - technological breakthrough - market penetration,' with significant demand, especially in the semiconductor and materials science fields.

Technological iteration and equipment upgrades: Advanced manufacturing processes (such as chips below 5 nanometers) increase the precision requirements of equipment, driving repair services towards higher resolution and automation. AI algorithms optimize

fault diagnosis efficiency, and the widespread adoption of 3D packaging technology expands the application scenarios of repair services. Technological upgrades continue to broaden market boundaries.

User demand and ecosystem expansion: The high requirements of scientific research institutions for equipment stability and the demand of enterprises to reduce costs and increase efficiency are driving the popularization of professional maintenance services. At the same time, the demand for microscopic testing in emerging fields (such as new energy and biomedicine) is growing, forming a multi-dimensional demand network of 'scientific research-driven - industrial application - consumption upgrade', which supports the long-term growth of the industry.
