Semantic image segmentation services are specialized platforms or tools that automatically divide an image into multiple segments or regions, where each segment is assigned a specific label or class. The goal of semantic segmentation is to classify each pixel in the image into predefined categories based on its content, such as 'sky,' 'road,' 'building,' 'tree,' etc. Unlike instance segmentation, which differentiates between multiple objects of the same class, semantic segmentation groups all pixels of a specific class together without distinguishing between individual instances.
