A semi-active shock absorber is a type of damping device designed to control and reduce vibrations and impacts in mechanical systems, particularly in vehicles like cars, motorcycles, or even in some industrial machinery. Unlike passive shock absorbers that have fixed damping characteristics, it can adjust its damping properties in real-time based on various input signals, such as vehicle speed, road conditions, or driver inputs. However, it doesn't actively generate forces like active shock absorbers but rather modifies its internal damping mechanisms to optimize the ride quality, handling, and stability, offering a balance between performance and cost-effectiveness compared to fully active counterparts.
