Semi-insulated ring main unit is a medium voltage switchgear used in power distribution networks, mainly used to distribute and control electric energy and protect power systems from faults. Its 'semi-insulated' feature refers to the fact that the cabinet body is made of a combination of some insulating materials and some conductive materials to achieve structural optimization and cost control, while having good insulation performance and safety. Semi-insulated ring main units usually use air, solid insulation or environmentally friendly gas as the medium. Compared with fully insulated ring main units, its scope of application is more flexible, maintenance is convenient, and cost-effective, and it is particularly suitable for small and medium-sized power distribution projects.
