According to our (Global Info Research) latest study, the global Selective Laser Melting Machines market size was valued at USD 175.8 million in 2023 and is forecast to a readjusted size of USD 231.7 million by 2030 with a CAGR of 4.0% during review period.

Selective Laser Melting is an additive manufacturing technique that can print metal parts in 3D. A laser is used to melt metallic powder in specific places. Selective laser melting uses a laser to melt successive layers of metallic powder. The laser will heat particles in specified places on a bed of metallic powder until completely melted. The CAD 3D file dictates where melting will occur.

During the sieving process the rough particles are sieved out and are separated in an overflow bottle. The reusable metal powder, which has the defined grain size, is transported to the storage container and can be directly used again.
