Abstracts

The global Semi Slick Tyre market size is expected to reach \$ 368 million by 2032, rising at a market growth of 6.8% CAGR during the forecast period (2026-2032). In 2025, global Semi Slick Tyre approximately 1,074 k units, with an average global market price of around US\$ 223 per unit. Gross margin is about 45%. The cost is 123 usd. Production Capacity is about 1,500 k units. A Semi-Slick tire is a high-performance tire positioned between street tires and full racing slicks, featuring minimal tread patterns to deliver strong dry-surface grip while retaining limited road usability. Upstream, its development depends on advanced rubber compounds, synthetic polymers, reinforcement materials, and tire engineering and manufacturing technologies; downstream, semi-slick tires are primarily used by performance car owners, track-day enthusiasts, amateur racers, and motorsport teams for applications that require enhanced handling, braking, and lap-time performance on dry or lightly wet circuits, balancing performance with durability and regulatory compliance.

Enhanced Dual Role for Street and Track Use

Semi-slick tires will further strengthen their dual attributes of 'street legality + high-performance track use,' covering more high-performance street and modified car users and expanding market boundaries.

Continuously Optimized Rubber Compound

Through new rubber compounds and material technologies, a better balance is achieved between extreme grip, wear resistance, and thermal cycle life, reducing user usage and replacement costs.

Gradually Improved Wet Performance

While maintaining advantages in dry performance, tread design and compound adjustments improve wet controllability and safety, reducing limitations in usage scenarios.

Increased Original Equipment and Official Certification

More and more high-performance models are using semi-slick tires as original equipment or official optional equipment, driving their penetration from the modification and racing markets into the more mainstream performance car market.

Data-Driven and Simulation-Driven R&D

Leveraging simulation design, track data, and vehicle electronic system feedback, tire structure and performance iterations are accelerated, improving the matching degree for different models and usage scenarios.
