According to our (Global Info Research) latest study, the global Semi-Tight Buffered Fiber market size was valued at US\$ 968 million in 2024 and is forecast to a readjusted size of USD 1484 million by 2031 with a CAGR of 6.3% during review period.

Semi-tight-buffered optical fiber is an optical fiber structure with a relatively loose buffer layer coated on the outer layer of the optical fiber. This design aims to balance the mechanical protection and flexibility of the optical fiber. It is suitable for scenarios where a certain amount of mechanical protection is required but the buffer layer is not too tight to affect the performance of the optical fiber. The semi-tight-buffered buffer layer can effectively absorb and disperse external forces, protecting the optical fiber from mechanical damage such as stretching and extrusion, but the degree of protection is not as good as that of tight-buffered optical fiber. The buffer layer is relatively loose, and the optical fiber is softer, which is convenient for wiring and installation in a small space. The outer diameter is between tight-buffered optical fiber and loose-buffered optical fiber, usually 1.6 mm to 2.5 mm, which is convenient for high-density wiring.
