Abstracts

Semiconductor capital equipment is machinery used in the production of semiconductor devices. Equipment for manufacturing semiconductor devices is classified as front-end or back-end based on the processes used. Front-end includes wafer fabrication along with other functions such as lithography, deposition, etching, cleaning, and chemical and mechanical polishing to name a few. Back-end encompasses assembly, packaging, and testing of ICs. Semiconductors are the building blocks for electronics. They form the crucial core of any electronic component. Semiconductor capital spending essentially refers to the capital investments by vendors in the semiconductor domain.

Scope of the Report:

This report focuses on the Semiconductor Capital Equipments in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Owing to benefits such as the smaller footprint and increased potential yield and the ability to provide a higher throughput since the IC is packaged while it is still a part of the wafer, the semiconductor capital equipment vendors primarily prefer the wafer-level technology.

The changing business environment in the semiconductor industry influences the foundries to upgrade their equipment to ensure a high throughput of reliable and quality offering. The growing demand for electronic devices will induce the electronic device OEMs and electronic manufacturing companies to order a higher number of

semiconductor devices for their end-products. This will subsequently drive the growth of the global market in this end user segment.

The worldwide market for Semiconductor Capital Equipments is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
