Abstracts

Semiconductor Etchant is an electronic chemical used in etching in semiconductor manufacturing.

In the electronics industry, the etching solution chemicals are varied depending on the material to be etched. For example, to perform etching of silicon (Si), a mixture of Dry Etching Agent (electronic grade) and nitric acid (electronic grade) is used. Other compounds are also added in the mixture to control the etch rate, the etch selectivity (ratio of etch rate of different materials), and the etch anisotropy (ratio of etch rate in the direction perpendicular to the surface to the etch rate in the direction parallel to the surface). The optimal etchant composition depends on the substrate and resist materials as well as the etching method.

According to our (Global Info Research) latest study, the global Semiconductor Etching Agents market size was valued at USD 2107.4 million in 2022 and is forecast to a readjusted size of USD 2880.4 million by 2029 with a CAGR of 4.6% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Global key manufacturers of semiconductor etching agents include Hubei Xingfa Chemicals, Stella Chemifa, BASF etc. The top 3 companies hold a share about 20%. Asia-Pacific is the largest market, with a share about 60%, followed by North America and Europe with the share about 20% and 16%. In terms of product, wet etching agent is the largest segment, with a share over 80%. And in terms of application, the largest application is integrated circuit, followed by solar energy and monitor panel.
