Abstracts

The release film refers to a film whose surface can be distinguished. The release film is not sticky or slightly sticky after contacting with a specific material under limited conditions. In the semiconductor flexible circuit board (FPC) preparation process, in order to prevent the metal lines on the flexible substrate from being oxidized and corroded by air, water vapor and other substances, which will affect the electrical performance of the FPC, it is usually necessary to cover one side of the printed circuit with a protective film. The protective film is bonded on the surface of the printed circuit by thermocompression, and if it is directly bonded, the covered protective film is easily bonded to the surface of the heating plate. The TPX release film plays a very important role in this process. On the one hand, it can prevent the covered protective film from sticking, and on the other hand, it can reduce defects such as glue overflow and wrinkles during the lamination process. Compared with other release films, TPX release film has good temperature resistance, filling and separation, which effectively improves the qualification rate of FPC flexible circuit boards, so TPX release film is mainly used for FPC flexible circuit boards of pressing.
