## Abstracts

According to our (Global Info Research) latest study, the global Semiconductor Grade Chelating Agent market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Semiconductor-grade chelating agents, also known as chelating agents for semiconductors, are specialized chemical compounds used in semiconductor manufacturing processes. Chelating agents function by forming stable complexes with metal ions, effectively sequestering these ions and preventing their undesired interactions with semiconductor materials and surfaces. In semiconductor manufacturing, the presence of metal contaminants can significantly impact the performance and reliability of semiconductor devices. Chelating agents play a vital role in mitigating the detrimental effects of metal impurities by binding to these ions and facilitating their removal from the semiconductor processing environment.
