According to our (Global Info Research) latest study, the global Semiconductor-Grade CVD Diamond Heat Spreaders market size was valued at US\$ 129 million in 2025 and is forecast to a readjusted size of US\$ 216 million by 2032 with a CAGR of 7.6% during review period.

Semiconductor grade CVD diamond heat sinks are high-performance thermal management devices made with high-purity CVD diamond as the core material. They are used in the heat dissipation path of semiconductor chips or power devices, utilizing their extremely high thermal conductivity (typically 1000-2200 W/m²K) to rapidly conduct and diffuse the heat generated by the chip, thereby significantly reducing device junction temperature and improving power density and reliability.

The upstream of the industry chain mainly includes carbon source gases such as high-purity methane and hydrogen, substrate materials such as diamond seed crystals, silicon wafers, silicon carbide (SiC), and molybdenum wafers, as well as suppliers of microwave plasma chemical vapor deposition (MPCVD) equipment, vacuum equipment, metallization materials, and packaging auxiliary materials. The midstream consists of semiconductor-grade diamond heat sink manufacturers, who grow high thermal conductivity polycrystalline or single-crystal diamond films using CVD processes and then prepare diamond heat sinks, heat spreaders, and composite heat dissipation substrates through processes such as cutting, polishing, thinning, metallization, copper plating, and bonding encapsulation. The downstream mainly uses diamond in high-power-density electronic products such as AI server GPUs and ASIC chips, optical communication lasers, data center accelerator cards, 5G/6G communication base stations, and aerospace electronic equipment. Diamond's ultra-high thermal conductivity

is used to solve the heat dissipation bottleneck of advanced semiconductor devices, improving device power density, reliability, and lifespan.

In 2025, global sales of semiconductor grade CVD diamond heat sinks are projected to reach 200,000 pcs, with a production capacity of approximately 285,000 pcs. The average selling price is \$628 per pcs, and the average gross profit margin is 40%-50%.

Major countries worldwide have prioritized advanced thermal management materials and third-generation semiconductors. The US, Europe, and Japan continue to promote the development of GaN, SiC, and quantum technologies, driving demand for diamond thermal management materials. China, through its policies on new materials, advanced packaging, and third-generation semiconductors, supports the development of related industrial chains, accelerating the localization of electronic-grade CVD diamond materials. In recent years, several international companies have successively advanced 2-inch to 4-inch single-crystal diamond wafer industrialization projects, marking the industry's transition from R&D verification to large-scale application.
