## Abstracts

The global Semiconductor Large Silicon Wafer market size is expected to reach \$ 25363 million by 2032, rising at a market growth of 8.1% CAGR during the forecast period (2026-2032).

Large silicon wafers are the only core materials that cost the most (over a third) to make. Demand for large silicon wafers is growing rapidly, helped by high-end demand for semiconductors.

As the base material of integrated circuits, silicon wafers have the characteristics of controllable resistivity and oxygen-carbon content. The single crystal ingot undergoes slicing, lapping, polishing, cleaning and other processes to obtain a silicon wafer with a specific thickness & geometric parameters and a clean surface.

Silicon wafers are the substrate material for semiconductors and are used in all kinds of devices, from smartphones, home appliances, automobiles and other devices that we see in our daily lives, to cutting-edge fields such as AI and IoT.

The global silicon wafer industry is a highly consolidated oligopoly: the Top 5 suppliers account for ~72.6% of the market, led by Shin-Etsu and SUMCO, followed by GlobalWafers, SK Siltron and Siltronic, with a long tail of smaller players (including engineered-substrate specialists and emerging Chinese wafer makers). This structure is not accidental: silicon wafers require capital-intensive crystal growth/polishing/inspection, extremely tight defect and flatness control, and multi-quarter customer qualification at leading fabs? factors that create high entry barriers and strong incumbency. The market?s near-term operating environment has also been two-speed: Our silicon wafers report noted that 300mm shipments grew year-on-year while 200mm-and-below weakened, reflecting soft ?legacy device? demand and inventory adjustments.

On the cycle and outlook, 2024?2025 has been characterized by a gradual normalization from the post-2023 correction, with the recovery led by AI-related silicon

demand rather than broad-based end markets. Our silicon wafers report explicitly links the pickup in 300mm shipments to AI, supporting advanced logic, cloud computing and memory applications, while noting that non-AI segments remain comparatively sluggish. This demand mix is consistent with vendor commentary: Shin-Etsu's financial-results summary states that AI-related devices are doing well while other device demand is still weak, and Siltronic similarly emphasizes that inventory recovery timing is uncertain even though medium-to-long-term fundamentals remain attractive. Structurally, the industry continues to be pulled by 300mm fab expansions?We projects 300mm fab capacity growth at close to a ~10% CAGR from 2022?2025, which mechanically raises the ?base load? for 300mm wafer consumption even in a choppy macro environment.

In terms of 12inch silicon wafers, the Top 5 players (Shin-Etsu, SUMCO, GlobalWafers, Siltronic, SK Siltron) capture ~80.1%, and the Top 10 reach ~92.3%?a reflection of how difficult it is to scale 300mm capacity while meeting leading-edge quality, uniformity and cost requirements. In practice, 12-inch wafer competition is less about ?who can make wafers? and more about who can consistently supply advanced-grade polished and epitaxial 300mm wafers for high-performance logic and memory, with stable yields and certified process windows over long qualification cycles. Capacity and technology roadmaps are therefore tightly linked: SUMCO, for example, highlights active steps to add 300mm capacity and convert equipment toward leading-edge wafers, underscoring the strategic focus on advanced 300mm demand rather than smaller diameters.

12-inch demand growth is increasingly AI-anchored. We state that 300mm shipment growth in 2025 is fueled by AI, supporting advanced logic, cloud computing and memory?exactly the applications that consume the most leading-edge 300mm capacity. Meanwhile, the geographic footprint of 300mm wafer supply is gradually broadening for resilience and policy reasons: GlobalWafers opened a major 300mm wafer facility in Sherman, Texas and discussed further U.S. investment plans (with CHIPS-related support), reflecting the broader trend toward supply-chain localization and multi-region redundancy for critical wafer supply. China's 12-inch ecosystem is also expanding in parallel (both on the fab side and the domestic wafer side): We expect China's share of 300mm fab capacity to rise meaningfully by 2025, while companies such as ESWIN publicly describe their Xi'an line as producing 12-inch polished and epitaxial wafers?a marker of domestic substitution efforts that can reshape the long tail of the 12-inch supply landscape over time.
