According to our (Global Info Research) latest study, the global Semiconductor Lasers market size was valued at USD 2773.9 million in 2023 and is forecast to a readjusted size of USD 5100.8 million by 2030 with a CAGR of 9.1% during review period.

A semiconductor laser (LD) is a device that causes laser oscillation by flowing an electric current to semiconductor. The mechanism of light emission is the same as a light-emitting diode (LED). Light is generated by flowing the forward current to a p-n junction. In forward bias operation, the p-type layer is connected with the positive terminal and the n-type layer is connected with the negative terminal, electrons enter from the n-type layer and holes from the p-type layer. When the two meet at the junction, an electron drops into a hole and light is emitted at the time.

The global semiconductor laser industry company is numerous, the competition is intense. The three companies with the highest annual revenues in 2018 are Sony, Nichia and QSI, accounting for 7.76%, 6.28% and 5.17% respectively.
