The global Semiconductor Plating Lithography Filters market size is expected to reach \$ 365.8 million by 2029, rising at a market growth of 6.0% CAGR during the forecast period (2023-2029).

According to the SEMI report, the semiconductor materials market will grow by 8.6% in 2022, hitting a new high of US\$69.8 billion in market size. Since semiconductor materials are an industry with high technical barriers, most high-end products of semiconductor materials are currently concentrated in the United States, Japan, Germany and other countries and regions. From a demand perspective, Taiwan, China, South Korea, Japan, and the United States are the world's largest semiconductor material markets, accounting for more than 80% of the global market. With the shift of the semiconductor industry, the global semiconductor materials industry has also experienced a shift of center of gravity from west to east. China's semiconductor materials market is the fastest growing region in the world. In 2022, the United States will introduce new regulations to sanction China's advanced semiconductor process industry. This will have a certain impact on all aspects of China's integrated circuit manufacturing industry in the short term. However, in the long term, China's integrated circuit industry will inevitably will embark on the road of independent innovation. According to research statistics from the company's 'Semiconductor Research Center', the global semiconductor materials market will be approximately US\$70 billion in 2022, the highest value in the history of semiconductor materials. At present, the production and technology of semiconductor materials are mainly controlled by the United States, Japan and a few European manufacturers. China's domestic manufacturers are relatively weak overall and have made breakthroughs in individual links. However, in terms of technology, product quality and application, they are still behind the world's leading manufacturers. There is a big gap. Currently, Taiwan, China and South Korea

are the three largest markets, accounting for approximately 60% of the market share. The United States, Europe, Japan and Southeast Asia are also important markets, with these four regions accounting for approximately 35% of the market share.

Semiconductor Plating Lithography Filters refer to filters used for semiconductor electroplating lithography. In the semiconductor manufacturing process, electroplating and photolithography are two important process steps. The electroplating process is used to deposit metal or other materials on the chip surface to form the desired electronic component structure, while photolithography is used to transfer photosensitizer patterns to the chip surface to define the precise layout of the electronic components. In these process steps, filters are used in different links to remove impurities, fine particles and other contaminants to ensure the quality and stability of the production process.
