Semiconductor Test Interface Boards (TIBs) are specialized test boards used in semiconductor testing to interface between the Automated Test Equipment (ATE) and the Device Under Test (DUT). These boards are critical components in the testing process, ensuring that the DUT is correctly connected to the ATE while providing the necessary electrical and signal conditions for testing. They are used in semiconductor manufacturing, research, and quality control to test the performance and functionality of integrated circuits (ICs), chips, and other semiconductor devices. TIBs are customized to the specific needs of the DUT and the testing requirements. They are designed to ensure accurate signal routing, maintain signal integrity, and handle the high-speed data transfer required during testing. These boards are essential for testing a wide range of semiconductor devices, including microprocessors, memory chips, power management ICs, radio-frequency (RF) components, sensors, and more.
