The global Semiconductor Wafer Tape market size is expected to reach \$ 1842.1 million by 2029, rising at a market growth of 5.6% CAGR during the forecast period (2023-2029).

The key manufacturers of Semiconductor Wafer Tape in the world are Mitsui Chemicals, LINTEC, Denka, Nitto, 3M, The Furukawa Electric, Sekisui Chemical, Resonac Corporation, and Sumitomo Bakelite Company, among which the top three manufacturers have a market share of over 50%. Currently, the largest manufacturer is Mitsui Chemicals. The production of semiconductor wafer tape worldwide is mainly concentrated in regions such as North America, Europe, and China, with the top three production regions accounting for over 90% of the market share, with North America being the largest production region. In terms of its product category, the growth rate of dicing tape is relatively high, and the market share is the highest, exceeding 60%, followed by back grinding tape and mold release tape. In terms of its application, wafer cutting is the largest application field, with a market share of nearly 60%, followed by wafer grinding and cleaning, packaging and masking, and acid etching.

Semiconductor wafer adhesive tape, also known as wafer scribing adhesive tape or simply referred to as wafer scribing adhesive tape, is a special adhesive tape used in the semiconductor industry to fix fine silicon wafers in place during the scribing process. One side of the adhesive tape has a strong adhesive that firmly adheres to the surface of the wafer, while the other side is typically made of a polymer film that provides support and stability during the scribing process. In semiconductor manufacturing, silicon wafers are typically divided into individual microchips through a process called scribing. The wafer is first coated with a photoresist, and then exposed to ultraviolet light through a photomask to form a circuit pattern on the wafer. The exposed area of the

photoresist is then chemically etched away, leaving a circuit pattern on the wafer surface. A dedicated saw is then used to cut the wafer along these patterns into individual microchips. Semiconductor wafer tape is used to hold the wafers together during the scribing process to prevent them from cracking or breaking. After scribing is complete, remove the tape, and clean and package the individual microchips for use in electronic devices.
