According to our (Global Info Research) latest study, the global Semiconductor Wet Process Analyzer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

At present, the semiconductor cleaning process mainly includes two categories: wet method and dry method. The dry method is mainly used for the ashing process of photoresist and the removal process after part of ion implantation. Wet methods are more widely used, including photoresist stripping and cleaning, cleaning after CMP, cleaning after etching, and cleaning after film deposition. Wet process analyzers are used to accurately monitor multi-component chemicals during wet processes, enabling users to maintain the concentration and ratio of chemical components in wet process solutions and prevent costs caused by non-optimal chemistry High yield loss.
