The global Sensor Based Mining Sorting Equipment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Sensor-based mining sorting equipment, also known as ore sorting or mineral sorting equipment, is a technology used in the mining industry to separate valuable minerals and ores from waste rock or low-grade materials based on their physical or chemical properties. This equipment employs various sensors and sorting techniques to enhance the efficiency of ore processing and improve the overall productivity of mining operations.

These systems utilize a range of sensors that can detect and measure the properties of mined materials, such as color, shape, density, electromagnetic properties, and chemical composition. The sorting equipment automatically identifies and separates valuable ore from non-valuable or low-grade material, eliminating the need for manual sorting, which can be time-consuming and labor-intensive. Sensor-based sorting equipment employs different technologies, such as X-ray transmission, X-ray fluorescence, near-infrared (NIR), and laser-induced breakdown spectroscopy (LIBS) to analyze and separate materials.

Sensor-based mining sorting equipment is a valuable tool for mining companies to optimize their ore processing and increase the recovery of valuable minerals. It is used in various mining sectors, including precious metals, base metals, industrial minerals, coal, and gemstone mining. And it plays a crucial role in improving the economic viability and sustainability of mining operations, while also reducing the environmental impact.
