Abstracts

According to our (Global Info Research) latest study, the global Separate Arrester market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

A separate surge arrester is a device used to protect power system equipment from overvoltage damage. It usually consists of splitters, surge arresters and switching devices. The main function of the separate surge arrester is to guide the overvoltage to the surge arrester when overvoltage is detected in the power system, thereby protecting other equipment from overvoltage. It is connected to the power system equipment through a switching device. When an overvoltage occurs in the power system, the separator will separate the power system from the arrester to avoid damage to the equipment caused by the overvoltage. The working principle of the split surge arrester is based on the relationship between voltage and current in the power system. When the voltage in the power system exceeds a set threshold, the separator switches automatically, directing the overvoltage to the arrester. Surge arresters keep overvoltages out of the power system by directing them to ground or another acceptable path.
