A separate jack is a hydraulic tool that is composed of a hydraulic pump and a main body of the jack. It is used to provide powerful lifting capabilities and adapt to various complex operating environments. Its design features are that the hydraulic pump is connected to the jack body through a high-pressure hose, and the pump and jack can be placed separately, making it particularly suitable for scenarios where space is limited or remote operation is required. The split jack uses the hydraulic principle and the characteristics of liquid pressure transmission to convert the operating force of the hydraulic pump into a powerful lifting force, which is suitable for handling the lifting tasks of heavy equipment.
